

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

I. *Observations on the Eclipse of the Moon, June 18, 1722. and the Longitude of Port Royal in Jamaica determined thereby.* By Dr. Halley, *Astronomer Royal, F.R.S.*

THE Eclipse of the Moon which happened in *June* last, 1722, was so far hid by the cloudy Sky, that neither myself, nor any of our Astronomical Friends, in or about *London*, could furnish an Observation thereof worthy to be laid before the Society. But the same having been well observed at *Jamaica*, by the late curious Capt. *Candler*, Commander of his Majesties Ship *Launceston*, (whose Example it were to be wished, others in the like Post would imitate) and at *Berlin*, by Mr. *Christfried Kirck*, Astronomer of the Royal Academy of Sciences there. I thought it not amiss to prefix to their Accounts that little I was able to note concerning it.

Sunday, June 18, mane, Having perfectly rectified my Clock so as to shew the Apparent Time, neither the transit of the Moon over the Meridian, nor the beginning of the Eclipse which soon followed, could be seen thro' the very thick Cloud. At 13 *b.* 12' *T. app.* a small Particle of the Moons Body was seen through a very little *hiatus* in the Cloud, by which glimpse I could only be assured that the Eclipse was not yet Total. At 13 *b.* 29' by such another view. I was satisfied that it was now become Total; but in a Moment, it again disappeared, till 14 *b.* 49' 10'', when the Cloud beginning to break, I got time to measure with the Micrometer, the *Partes Lucidæ* now recovered in the Moon's Diameter, which I found 14'. 00'', though this not so well as I could wish, by reason of a thinner Sort of Cloud which perpetually intercurr'd, and render'd the Edge of the Shadow somewhat dubious.

At 15 *b.* 15' the Moon was pretty well got out of the thick Cloud, but being very low, and the Daylight become strong, she shone very faintly, and the Shadow became worse and worse defined.

From

From 15 h. 26' to 15 h. 27' T. app. I doubted of the End, and am confident it did not exceed the 27th Minute. It ended overagainst the North Part of the *Palus Mæotis* of Mr. *Hevelius*, much about the middle of the Western or Right-hand Limb of the Moon, she being then very near setting.

Capt. *Barth. Candler*, being then at *Port Royal*, in *Jamaica*, had much better Fortune, and a serene Sky from the Beginning to the End; who having used due care to be assured of his Times, by Altitudes taken with an Instrument of three Foot *Radius*, was pleased to send us the Result of his Observation as follows.

	<i>h.</i>	<i>'</i>	<i>"</i>
The Eclipse began	6	59	10
Immerfion	8	7	50
Emerfion	9	11	0
The End	10	19	40
Whence the Middle	8	39	25

And fupposing the Eclipse to have ended at *Greenwich*, at 15 h. 26' $\frac{1}{2}$ the Difference of Longitude between *Port Royal* and *Greenwich*, will be 5 h. 6' 50'', or 5 h. 6' $\frac{1}{2}$ from *London*, that is, 76 gr. 37' $\frac{1}{2}$.

Mr. *Kirck* being in a more Easterly Meridian, could fee nothing of the Emerfion, but has carefully noted the Time of the Beginning and Immerfion, as he observed them at *Berlin*, viz. the Beginning of the Eclipse at 12 h. 59' 55'' and the Immerfion at 14 h. 8' 8''. Now by comparing feveral Observations made at both Places, we have formerly concluded *Berlin* to be 54 Min. of Time, or 13 $\frac{1}{2}$ grad. of Longitude more Easterly than *London*; wherefore at *London* it began at 12 h. 5' 55'' and immerged at 13 h. 14' 8'' that is, the beginning was later here than at *Jamaica* 5 h. 6' 45'', and the Immerfion later 5 h. 6' 18'', punctually agreeing with what resulted from my own Observation of the End as abovefaid; and fufficiently with what I had long fince determined from Observations fent me from *Jamaica* by my old Astronomical Friend Mr. *Charles Boucher*.
